

CLAIMS

What is claimed is:

1. A system for providing remote access to at least one target computing network, comprising:
 - at least access server resident in the target computing network;
 - a point-of-presence node communicatively connected to the at least one target computing network; and
 - at least one computing device connected to the point of presence node.
2. A system for providing remote access to at least one target computing network, comprising:
 - at least one front-end access server resident in the target computing network; and
 - at least one computing device connected to the point of presence node.

3. A method for providing remote access to at least one target network,
comprising:

- at a remote computing device:
 - generating, at a remote computing device, a network access request;
 - transmitting the network access request to an access server resident
in the target network; and
- at the access server:
 - receiving the network access request;
 - processing the network access request; and
 - establishing a network connection with the remote computing
device.
